HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

March 7, 2022

VIA JAMS ACCESS

Special Master Daniel B. Garrie  
DGarrie@jamsadr.com

Re: *In re Facebook Consumer Privacy User Profile Litigation*, JAMS Ref No.  
1200058674

Dear Special Master Garrie,

Pursuant to the Hearing Order Regarding Plaintiffs' Motion To Compel Production of Plaintiff Data dated February 21, 2022, we submit this response on behalf of Facebook. We also thank the Special Master for granting an extension of our time to respond to allow us to provide responses that we believe would assist the Special Master in expediting resolution of the issue set forth by Judge Corley in her January 12, 2022 order: "[W]hat, if any, data from [systems other than DYI] should be produced consistent with Federal Rule of Civil Procedure 26(b)."

**I. USER DATA IN DYI**

The Special Master's first two questions seek information about what user data is included in DYI. We welcome the opportunity to address that issue to correct and clarify statements made throughout these proceedings which seem to have created the impression that the DYI system is limited to the first category of "discoverable user data" identified by Judge Corley in Discovery Order No. 9. As explained below, the DYI system includes *all three categories* of data: (1) data collected from a user's on-platform activity, (2) data obtained from third parties regarding a user's off-platform activities, and (3) data inferred from a user's on or off-platform activity. So the issue is whether Facebook should produce *more data* in categories (1), (2), and (3) from systems other than DYI, which we understand is the focus of the Special Master's remaining questions.

## GIBSON DUNN

Special Master Daniel B. Garrie  
March 7, 2022  
Page 2

HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

**Question #1.** Engineer documentation for the process of generating the DYI file for a Facebook user, including data flow diagrams that explain how the data is retrieved, data schemas, and the individual fields for each data type in the schema.

The following DYI engineer documentation is attached as **Exhibit A**.

- **Your Information Schema (DYI).** This schema describes each of the categories and types of data included in DYI.
- **Eng Guide: Adding to DYI Wiki.** This document provides step-by-step instructions for engineers from product teams to add data to DYI, including instructions regarding where data should live in the DYI taxonomy and DYI schema fields.

**Question #2.** A statement clarifying whether information available via the DYI tool “includes user data provided by third parties to Facebook, e.g., data relating to users’ off platform activity.”

Yes, DYI includes user data provided by third parties to Facebook, which is the second category of “discoverable user data” identified by Judge Corley in Discovery Order No. 9. Since this data is stored as raw logs of event data in Facebook’s data warehouse, Facebook had to build data pipelines from the data warehouse to production to (a) aggregate and group this event level data on a per user basis sorted in chronological order and (b) transform raw logs of event data in the data warehouse into a human readable information. This effort required complex and time-extensive engineering efforts.

This question from the Special Master highlights a broader factual issue, which we believe should be clarified to assist the Special Master in resolving the issue before him. In Discovery Order No. 9, Judge Corley identified the following categories of “discoverable user data”: (1) data collected from a user’s on-platform activity, (2) data obtained from third parties regarding a user’s off-platform activities, and (3) data inferred from a user’s on or off-platform activity. Plaintiffs repeatedly have asserted that DYI contains *only* data in category (1), citing a statement by Facebook’s counsel during a status conference before Judge Corley.<sup>1</sup> In fact, the full exchange with Judge Corley makes clear that Facebook’s counsel was explaining that the DYI tool does not contain *all* data in categories (1), (2) and (3), which is further demonstrated by the answer to this question confirming that DYI includes

Page 3

## HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

data in category (2). Plaintiffs also have cited documents produced by Facebook that they claim prove Facebook's production is limited to *only* data in category (1), most notably, a document referring to "Native Data," "Appended Data," and "Behavioral Data."<sup>2</sup> Again, this is incorrect. **Exhibit B** attaches the primary document Plaintiffs cite for this assertion and a table that describes how the Native, Appended, and Behavioral Data described in that document is either included in DYI or relates to features that were deprecated before this case was filed.

For completeness, we explain below the data in categories (1), (2), and (3) that are included in DYI, and attach as **Exhibit C** summaries of the data that has been produced for each of the named plaintiffs.

**Category (1): Data collected from on-platform activity.** DYI includes data provided by users and data observed by Facebook on the platform.

*User-provided data* includes profile data, user-generated content (e.g., posts, videos, photos, comments, stories), message content, friends, location check-ins, linked accounts in the Facebook family of products, and language choices.

*Observed data* includes clicks, profiles, Pages, Groups, and Events a user has visited, usage data, device data, networks and connections, data about user's activity level, advertisers with which the user has interacted, pages (user pages, pages a user liked or recommended, pages a user follows, pages a user has unfollowed), IP address when sending a message, users that a user has chosen to "see less" or "see first" in News Feed, time spent watching from a page, people whose profile a user has visited, last location, last active time, whether a user viewed someone's birthday story, people a user blocked on Messenger, page notifications, pages a user recommended, time zone, email address verification, Marketplace notifications, and interactions.

**Category (2): Data collected from off-platform activity.** DYI includes information provided to Facebook by third-party advertisers, app developers, and publishers about user interactions.

User interactions are things like opening a third-party developer app that integrates Facebook business tools, and visiting websites that integrate the Facebook business tools providing information about the user viewing content, searching for items, adding an item to a shopping cart, or making a purchase. Third parties share this off-platform activity with Facebook using "business tools," which are technologies designed to help website owners

---

<sup>2</sup> Pls' Sept. 28, 2020 Mot. Compel at 8, Dkt. 526.

Page 4

## HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

and publishers, app developers, advertisers, and others, integrate with Facebook, understand and measure their products and services, and better reach and serve people who use or might be interested in their products and services. Business tools include Facebook Pixel, Facebook SDK, Conversions API, Offline Conversions, and the App Events API. Facebook also receives impression data through Facebook Social Plugins (e.g., Like and Share buttons) and Facebook Login.

Facebook also receives contact lists with user information uploaded by advertisers for the purpose of serving ads to those users through what are referred to as custom audiences. These lists include hashed information about users (e.g., email addresses, phone numbers) that is used to try to match people on the list with Facebook user accounts; matched users are placed in the custom audience. This hashed information is discarded after the matching process.

**Category (3): Data inferred from a user's on or off-platform activity.** DYI includes data that is derived from a user's on or off-platform activity.

DYI includes information regarding ads interests; music recommendations based on genres of music a user has interacted with on Facebook; "your topics," which is a collection of topics determined by a user's activity on Facebook that is used to create recommendations for users in different areas of Facebook such as News Feed, News, and Watch; primary location; primary public location; friend peer group; creator badges (including labels like "visual storyteller" or "conversation starter" based on activity in Groups); time zone; language preferences (including preferred language for videos, languages you may know, preferred language); and mobile service provider and country code.

**Plaintiffs' DYI Data.** Summaries of the DYI files for each named plaintiff showing that they include all three categories of "discoverable user data" identified in Discovery Order No. 9 are attached as **Exhibit C**.

## II. OTHER USER DATA AND SYSTEMS

The Special Master's remaining questions focus on understanding what other systems contain user data and, as Judge Corley stated the issue, "what, if any, additional data should be produced consistent with Federal Rule of Civil Procedure 26(b)." To be sure, the DYI file does not include all data related to users, but that does not mean that production of that data is consistent with Rule 26. For example, as explained above, DYI includes data received from third parties regarding a user's off-platform activity on apps and websites, such as viewing content and adding an item to a shopping cart, but does not include data identifying

# GIBSON DUNN

Special Master Daniel B. Garrie

March 7, 2022

Page 5

## HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

the specific content that was viewed or the item that was added to a cart for reasons that engineers will be prepared to explain at the hearing.

**Question #3:** A statement identifying systems that coordinate and schedule jobs that run against the Hive (a process that accesses table data in the Hive and aggregates user data to produce a meaningful data set). For each job that may involve user data, Facebook is to describe the data extracted in the job and where the job saves the data.

The majority of batch data processing of Hive data at Meta is handled by a system called Dataswarm, which is described below. The remaining minority of batch data processing is coordinated by FBLearder, which is a similar system derived from Dataswarm.

Dataswarm works by having employees (1) define atoms of computation called tasks and then having employees (2) explicitly state the dependency relationships between these tasks so that the system can initiate a task's computations after the preceding tasks have completed their execution. These tasks are treated as black boxes: the system knows nothing about what the task does beyond the rough type of computation performed. For any given task, Dataswarm does not know what data is used as inputs to the computations it orchestrates or what data is produced as outputs by these computations.

Facebook's current approach for identifying what data is consumed as inputs by a job and is generated as outputs by that job is a time-consuming manual process. Because Dataswarm performs millions of tasks each day, it is not possible to complete this manual process for all Dataswarm tasks. To respond to the Special Master's request, Facebook completed this manual process for a sample of 10 tasks run in Dataswarm on February 15, 2022. This sample is attached **Exhibit D**. Approximately five million Dataswarm tasks were run on February 15.

**Question #4:** A statement identifying the internal identifiers Facebook uses to track users across the Facebook platform, including a description of which Facebook systems use each identifier, how each system uses each identifier, and how Facebook maps identifiers to users.

Facebook primarily uses four types of internal identifiers for user data: (1) a user identifier (UserID), (2) Replacement ID, (3) Separable ID, and (4) App Scoped Identifiers. Each is described in more detail below.

**UserID.** Facebook uses an industry-wide technique called pseudonymization to represent users on the Facebook platform. In essence Facebook creates a canonical unique

# GIBSON DUNN

Special Master Daniel B. Garrie  
March 7, 2022  
Page 6

## HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

identifier that encapsulates information about the user (such as First Name, Last Name, email, phone numbers, etc). The encapsulation can be accessed by an identifier called a user identifier (or UserID); this is similar to a row being stored in a database table with the primary key being the userid and information of the user being values in the other columns. UserIDs are unique in Facebook's systems, such that two users cannot have the same UserID, and they are not recycled, meaning even after a user deletes their account, no other user can have the same UserID. The User ID is the canonical identifier to represent a Facebook user and is used in nearly all Facebook systems.

**Replacement ID (RID).** The RID is an identifier that supports Facebook's deletion practices by irreversibly disassociating data from a user. Every user is assigned an RID for the lifetime of their account. In data systems that do not support deletion (e.g. Hive), any user data retained for more than 90 days can only be retained with an RID. When a user deletes her account, Facebook deletes the record connecting the UserID to the RID so that data stored with that RID can no longer be connected to that user. Like the UserID, the RID represents a single user. Two users cannot have the same RID, and RIDs are not recycled. RIDs are used in Hive.

**Separable ID (SID).** The SID is similar to the RID, but allows Facebook to permanently disassociate Off Facebook Activity data from a user. Data Facebook receives from third parties about a user is associated with an SID (rather than UserID), and Facebook maintains a separate mapping between SIDs and UserIDs that can be accessed when data is processed. Through Facebook's Off Facebook Activity tool, users are able to clear their Off Facebook Activity. When a user does this, Facebook removes the mapping between the users' SID and UserID, which irreversibly dissociates the data stored with an SID from the user. Facebook then generates a new SID to be associated with the user's account moving forward. SIDs are used in Hive. More information about SID's is available at this link: <https://engineering.fb.com/2019/08/20/data-infrastructure/off-facebook-activity/>

**App-Scoped ID (ASID).** The ASID is an identifier that is sent to the third-party developer when a Facebook user has chosen to use the Facebook Login product to login to the services of the third-party developer. The App-Scoped ID also serves as a privacy protective identifier that Facebook created with the purpose of preventing different third-party apps from sharing data or amassing profiles of users across apps. This is why the App Scoped ID is created on a per-user per-app basis, such that different third-party developers do not receive the same identifier for the same Facebook user. ASIDs are stored in TAO.

## GIBSON DUNN

Special Master Daniel B. Garrie  
 March 7, 2022  
 Page 7

HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

**Question #5:** A statement identifying the sources from which Graph API pulls user data, including a high-level description of each source and the engineers that own each source.

**TAO.** The Facebook production infrastructure is centralized around a distributed data store for the social graph, called TAO (The Associations and Objects), which is the primary source from which Graph API pulls data (including user data). TAO is a high-performance service for storing, caching, and querying the graph for nodes and associations, by providing a clean interface for internal and external developers to integrate into the social graph, abstracting away many of the complexities of developing and maintaining a data storage at scale.

- **For more information about TAO:** <https://engineering.fb.com/2013/06/25/core-data/tao-the-power-of-the-graph/>
- **Technical Point of Contact:** Redacted

TAO provides a layer of abstraction to describe objects and relations through EntSchema and Node. The underlying technology that is used to store these data models is a collection of technologies such as MySQL, Manifold, ZippyDB/Akkio, Memcache, and Laser. In limited cases, and for specific purposes, other systems may access these systems directly.

**MySQL:** MySQL is TAO's backbone. It provides transactional and availability properties to columnar data. For example, a user's comment can be stored in a MySQL database as a row in a table, where the comment id is the primary key and the comment is a text field. As another example, the fact that someone liked a comment can be represented by an association with the type like from the comment id and the user id, this could be represented as 3 columns in the table, with comment id, user id, and type of reaction.

- **Technical Point of Contact:** Redacted

**Manifold:** Manifold is a managed horizontally scalable BLOB storage service accessible via Thrift, and HTTP, and client API libraries. It is feature rich and analogous to Amazon S3 in that it supports file and directory services for both large and small objects. It also supports cross region storage, deletion via TTL, strong QoS guarantees, and optional automated backups. It uses other storage subsystems—Everstore, ZippyDB, MySQL, Hive, and WarmStorage—for metadata and data storage, as well as standard internal infrastructure for deployment and management.

- **Technical Points of Contact:** Redacted

## GIBSON DUNN

Special Master Daniel B. Garrie  
 March 7, 2022  
 Page 8

## HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

**ZippyDB/Akkio:** ZippyDB is a persistent key-value storage service that provides reliable, scalable, geo-replicated storage for high throughput applications. ZippyDB provides very efficient key value lookups, faster than MySQL but are not transactional in nature. Akkio operates on top of storage services like Zippy. Akkio splits the data sets into units with strong locality, which can then be geographically placed close to where they are most likely to be accessed.

- **For more information about ZippyDB/Akkio:**  
<https://engineering.fb.com/2021/08/06/core-data/zippydb/> (ZippyDB);  
<https://engineering.fb.com/2018/10/08/core-data/akkio/> (Akkio).
- **Technical Points of Contact:** [Redacted] (ZippyDB), [Redacted]  
 [Redacted] (Akkio)

**Memcache:** Memcache provides a cache to the TAO service, the cache ensures that queries that have recently run are available quickly through the cache, as the response time of a cache are orders of magnitude quicker than a lookup in a MySQL database.

- **Technical Point of Contact:** [Redacted]

**Laser:** Laser is an indexing service that provides low-latency (typically a few milliseconds) read access to specific sets of Data Warehouse data. Data in the Data Warehouse is not indexed on a per user basis, but some Facebook products need to surface the calculations that the product performs to the production systems so a GraphAPI can request the data. Laser is only used to support first-party (i.e. Meta) products.

- **Technical Point of Contact:** [Redacted]

There are other technologies that keep TAO operational that ensure the service is performing at a high-performance.

**Question #6:** Any agreements relating to user data that Facebook has with each of the following entities: Netflix, Microsoft, and YouTube.

Facebook will submit via email to the Special Master and Plaintiffs contracts relating to user data with Netflix, Microsoft, and YouTube that have been produced in this case. Facebook will separately submit to the Special Master contracts with these entities that have not been produced to date in camera, to provide Facebook an opportunity to fully analyze

GIBSON DUNN

Special Master Daniel B. Garrie  
March 7, 2022  
Page 9

HIGHLY CONFIDENTIAL—ATTORNEYS EYES ONLY

and comply with any notice provisions in these agreements. Once Facebook has completed this analysis and complied with any notice provisions, Facebook will produce the contracts to Plaintiffs, consistent with Facebook's agreement to search for additional contracts Plaintiffs recently requested.

Facebook notes that Meta Platforms, Inc., Netflix, Microsoft, and YouTube are some of the largest technology companies in the world. These entities are parties to a very large number of agreements, the vast majority of which are confidential business agreements and outside the scope of this litigation. Should Facebook identify additional agreements with these entities that are responsive to the Special Master's request, Facebook will provide them.

**Question #7:** Update list of 149 systems identified in the Declaration of David Pope.

In discussing the topics and questions to be addressed during the hearing on Wednesday, March 9, 2002, the engineers who will be attending the hearing have explained to counsel that the list of 149 systems and categorization discussed during the hearing with David Pope on January 14, 2002, are not an effective way of assisting the Special Master in understanding the user data that exists in Facebook systems. Instead, they approach this question from the perspective of a Facebook engineer building product experiences or conducting data analysis who think of user data in terms of production systems and the data warehouse. As these engineers will explain at the hearing, they look to TAO for production systems with narrow exceptions, and to Hive for the data warehouse.

Sincerely,

A handwritten signature in cursive script, reading "Rosemarie Ring".

Rosemarie T. Ring

# Eng Guide - Adding to DYI

If you need to add to DYI, AYI and Activity Log see the [Eng Guide - Adding To YFI \(DYI, AYI, Activity Log\)](#) for a complete view.

**WARNING:** Speak to Privacy XFN before adding data to DYI. You'll need to provide your Privacy XFN decision task in all diffs.

Before you start Eng implementation make sure you have reviewed the [Additions Process](#).

**IMPORTANT:** Go through the [diff checklist](#) to make sure you've got all elements required for your addition.

YEA!! You're adding data to DYI. You're ensuring users have access to their data and helping to keep Meta compliant with GDPR, CCPA and other privacy regulations.

## Step 1: Determining Where your Data Should Live in the Data Taxonomy [Always Needed]

Your actual data will be pulled in a DYI field. These fields are grouped together into logical groupings represented by the DYI Schemas. Normally you do not need to add a new DYI Schema.

To determine where your data should live:

1. Go to [www.facebook.com/dyi](http://www.facebook.com/dyi), and figure out which category (e.g. Posts, Friends, etc.) your data might fit in. If none of these look reasonable, you may need to add a new grouping.
2. Put together a proposal for where you think your data would fit in the [DYI and AYI/Activity Log Additions XFN group](#). Be sure to follow the direction on the pinned post.
3. Once you have approval from Misti Pinter on the proposal (and have visited her office hours), you'll be ready to start coding!

## Step 2: Add a new Logical Data Grouping if Needed [Usually not needed]

**WARNING:** In most of the cases, you don't need this.

Each Logical grouping corresponds to an entry in the `DYIDataType` enum and a `DYISchema` class.

1. Add a new entry for the `DYIDataType` enum that represents your new data grouping. Please follow comments to keep numberings logical.
2. Create a new class that overrides `DYIDataSectionSchema` in the folder [flib/support/dyi/schema](#). You can copy paste an existing file there and fixup all the functions to return the right things; most of the functions are pretty self-explanatory. We will describe how to fill in the `getFields` function in the next sections.

Now that your data type exists, you need to add your data to it. There are currently two different ways to integrate your data to DYI. You can leverage an existing (and landed) Activity Log integration, or you can do a custom integration.

If your data should appear in Activity Log then you should continue [Step 3 Option 1: Adding data from Activity Log](#).

If not, continue with [Step 3 Option 2: Adding data from a Custom Fetcher](#).

### Step 3 Option 1: Adding Data from Activity Log

Before you can do this, you need to get your data to appear in Activity Log first. If you have not done so yet, please follow this [guide](#). Your Activity Log integration needs to be landed before you can use it in DYI.

[illegible]

DYIDDataType::POSTS\_YOUR\_ACTIVITY then the fetcher file should be DYIPostsYourActivityDataFetcher.php . If all fields added were pulled from activity log, this file should be automatically populated through the codegen.

Redacted

o

Redacted

[illegible]

- use your new custom structure in the original data schema file.

Redacted

- o For large data results (possible to have more than 5K results) you will need to add checkpointing to your configuration. To add in the ability to cursor over your data query, you need to enable checkpointed fetching with `setCheckpointedFetching`. It takes a vector of `DYICheckpointSchema`. You can define any type of cursor, but string is the most common since that's what `EntQuery` cursor types are. An example configuration is in `saves_and_collections_v2`. For the most common configuration, provide a name for the checkpoint, and the type of checkpoint. Each checkpoint added will create a separate `Fetcher` query method to implement. A configuration including this would be like

Redacted

Response	Percentage
Yes, the current administration is responsible	75%
No, the current administration is not responsible	25%

Redacted

In general, this API is somewhat similar to EntSchema.

2. Run the following:

Redacted

Redacted

3. Add in the data fetching code (for each fetcher method generated if using multiple checkpoints). The generated code is stubbed to return null so `hh` will not fail, but it needs you to write code to actually return the data. If your data type is `Redacted` `Redacted`. There will be newly stubbed method to fill out. A relatively straightforward diff example is [D33035672](#). Your fetching code should do the following:

- Query the appropriate data owned by the user (target/prospectiveVC)
- Constrain data by time (if time is associated with the data, it usually is)
- Populate the data structure (string, vec, structure) you configured in the `DYISchemaField`.

If your data is checkpointed you will need to also account for creating a cursor.

4. Add in the custom rendering code. The generated code is stubbed to return a json dump of your return structure into an html file. It's not cute. So we need to make it pretty. If your data type is `Redacted` then the file that contains an area to add your rendering should be `Redacted`. In this file You should ensure that the structure is rendered nicely with xhp elements by implementing the `genCustomHTML` method associated with your new field. There are some example xhp elements used for this in [www/flib/support/dyi/page/xhp/object/](#).

## Step 4: Addressing Data Visibility and Job Types [Always Needed]

Each schema for a corresponding `DYIDataType` and each schema field can set custom visibility rules. Schemas can do so by overriding the `Redacted`. Schema fields can use `Redacted`. The visibility rules are nested, rules that are applied at the data type level will apply to all fields belonging to that data type.

**Note: Every Schema must specify which job types (maps to profile types) to allow. For information on which job types are related to which profile types please see the [FAQ section on what profile types match which job types](#).**

Redacted

If your data needs to support Redacted the respective job types are

Redacted

Redacted

Redacted

make sure your data fetchers work for these job types by testing with these account types

Additional visibility rules can be added to provide further gating if needed (GKs, platforms, specific product users). See the [visibility folder](#) for supported types.

## Step 5: Testing [Always Needed]

Now that you've specified the data type and filled in the fetcher code. You should test your additions by requesting a DYI job. You can **ONLY** do this directly from the terminal with Redacted. You will *NOT* be able to test this through the facebook.com/dyi product UI as the jobs created through this interface will be using the prod environment.

For examples of test script commands for various types of jobs see the [FAQ section on how do I test](#)

To run a basic test for the standard user type with the DYI test user run the script with:

Redacted

Redacted

Redacted

Inspect the resulting html archive to verify that your new data shows up. You can use Redacted Redacted Redacted).  
Redacted

You should probably do this as fetching all your data can take quite a long time.

Your diff will need screenshots for each different profile type allowed in your configuration.

## Step 6: Adding Regression Test Data [Almost Always Needed]

If your data is associated with a regular user (and more types coming soon) and does not have a short TTL you need to ensure that the regression tests we have setup will work for your new data.

If your data has a TTL, you will need to specify this using the **Redacted** on your field definition. Otherwise your diff will not be approved unless you generate the regression data for the **Redacted**. Information on how to log in to the test account and update the regression tests (aka snapshot tests) see the [Adding Snapshot Tests](#) section

Your diff will need to include the json data for the test user in [www.flib/support/dyi/\\_tests/\\_snapshots\\_v2\\_](http://www.flib/support/dyi/_tests/_snapshots_v2_)

## Step 7: Possibly Bumping DYI Version Number [Sometimes Needed]

If the underlying thrift schemas generated are not backward compatible you will need to bump the dyi version number. We try to avoid this because it causes all inflight jobs to start over. But sometimes it's needed.

If you add a new schema, delete a field or modify field order, this is more likely to be needed. If you add a new field to the end of a list of existing fields in a DYISchema, you should not need to do this step.

To determine if you need to bump the version number view the [DYI Codegen.thrift](#) file changes in your diff. If any line has red (other than the signature line) then your change is not push safe. You will need to run the following command

```
phps DYIBumpVersionNumber
```

## Step 8: Submitting your Diff [Always Needed]

Submit your diff and include 'dyi' as one of the reviewers.

**WARNING:** Do not land a new data addition with out a review from dyi team member

We're working to make these diffs not require dyi as a reviewer, but we're not all the way there yet and we are trying to avoid changes that break DYI

## Some tips

- Your content (everything you put in an fbt) should be reviewed by a content strategist and fully translated (we support 50+ languages) before you ship this to the public.
- You can add `DYIVisibilityGKRule` or `DYIVisibilityAllowInternalOnlyJobsRule` to the fields of your new data (or in **Redacted** for the new data category you created) to restrict the visibility of your new data until you're ready to ship it.
- When testing you may have to self grant permission to production data here: [https://www.internalfb.com/intern/core\\_data\\_access](https://www.internalfb.com/intern/core_data_access). Errors may look like [P317501522](#)
- If you have any doubts, please contact the [dyi\\_infra](#) or post in the [Q and A group](#) and get some guidance there.
- You can use `DYIStoryInspector` (<https://fburl.com/qbpt2sc7>) to debug your activity log data

## **EXHIBIT B**

<p><b>Appended Data</b> defined as follows: (1) Data brokers (partner categories): public records, auto registration data, supermarket loyalty cards, retail purchases (e.g., Walmart), credit card purchases (Argus); (2) Advertisers (custom audiences, offline conversion measurement): Existing customer relationships, purchase history); and (3) Both (managed custom audiences, offline conversion measurement): Customized third-party data (usually opaque to FB).</p>	<p><b>Included in DYI/Deprecated.</b> For (1), “partner categories” were deprecated in 2018. For (2) and (3), information about custom audiences, managed custom audiences, and ad interactions/pixel data for offline conversion measurement is included in DYI.</p>
<p><b>Behavioral Data</b> defined as follows: (1) Web pixels (conversion pixel, website custom audiences). Includes website browsing behavior, explicit actions (likes, logins) off FB; (2) Web SDK (like button, FB login) Includes website browsing behavior, explicit actions (likes, logins) off FB; (3) Mobile SDK (app integrations, app installs, app events, autofill/payments) Includes mobile apps installed, explicit actions (likes, logins) off FB; and (4) Onavo. Includes opt-in panel: all device network activity.</p>	<p><b>Included in DYI/Deprecated.</b> For (1), (2), and (3), this information is included in the DYI file. We note that the reference to “autofill/payments” is unclear, so we are unable to confirm whether it is in DYI. For (4), Onavo was deprecated in early 2019 and any associated data would either have been largely duplicative of app event data received through the mobile SDK or was not associated with particular users.</p>
<p><b>FBX.</b> FB establishes a match table between a FB user and a 3P ad server’s cookie. This enables the 3P to show ads on FB to users that have visited websites where the 3P has placed one or their cookies on the user’s browser. The cookie sync is triggered by the 3P (it calls a FB endpoint) and is matched against FB’s FR cookie.</p>	<p><b>Deprecated.</b> FBX was deprecated in 2016.</p>
<p><b>Custom audiences:</b> We allow advertisers to upload lists of their customers to have ads shown to them on FB. We create custom audiences today based on email addresses, phone numbers, FB user IDs, and Apple iOS IDFAs. We also allow mobile app developers to create custom audiences based on information that they have provided to FB via the FB mobile SDKs.</p>	<p><b>Included in DYI.</b> See above.</p>

<p><b>FB Mobile SDKs.</b> Developers can choose to send information about how their users interact with their apps to FB. Developers can set up “custom app events” within their app using the FB Mobile SDKs. When a user does a pre-defined action, developers can have the FB SDK send each activity to FB. We log that information to court app installs and aggregate them for app analytics. By default, the SDK is set to report installs only (though the developer can turn this off). Tracking is done with Apple’s IDFA or with FB’s SDK attribution ID on Android.</p>	<p><b>Included in DYI.</b> See above.</p>
<p><b>Conversion tracking.</b> Websites can implement a FB pixel that is triggered when users land on specific pages. The pixel sends information from the user’s FR cookie to FB and we attribute the conversion with a specific ad.</p>	<p><b>Included in DYI.</b> Ad interactions/pixel data included in DYI.</p>
<p><b>Website custom audiences.</b> Websites can implement a FB pixel (different from conversion tracking) that is triggered when users land on specific pages. The pixel sends information from the user’s FR cookie to FB. FB resolves that info back to a specific user and FB places that user into a custom audience for that advertiser. Users can opt-out of this process through a cookie-based opt-out accessible from the Ads privacy settings page on FB.</p>	<p><b>Included in DYI.</b> See above.</p>
<p><b>Partner categories.</b> FB partners with select data partners and allows that to create custom audiences based on their own data. These custom audiences (called “Partner Categories”) are then available for use by any advertiser on FB. Data partners include DataLogix, Epsilon, Acxiom, and Experian. Users can opt-out of these categories through partner-specific opt-outs.</p>	<p><b>Deprecated.</b> Partner categories were deprecated in 2018.</p>

<p><b>Offline measurement (via partners).</b> FB works with DataLogix and Acxiom to help advertisers measure the effectiveness of their ads at driving in-store sales. FB provides partners with ad exposure data. Partners then use in-store sales data provided by retailers to the data partner to measure the sales lift from users that saw ads for the products being advertised.</p>	<p><b>No user-level data.</b> Offline measurement via partners does not involve FB receiving user-level data.</p>
<p><b>Offline measurement (directly with FB).</b> Similar to the previous offline measurement product, except without an intermediary partner. Advertisers (usually retailers) provide transaction data directly to FB and we generate the sales lift reports for the advertiser.</p>	<p><b>Included in DYI.</b> See above.</p>
<p><b>Argus.</b> FB uses Argus dataset on credit card transactions to build models on buying habits of certain types of users. We are currently not using this [in] any production systems.</p>	<p><b>Does not exist.</b> Facebook terminated its testing of data provided by Argus in 2015.</p>
<p><b>Other data sets.</b> FB occasionally acquires data sets to help inform different user models. For example, we get census data to determine which zip codes are high-income zip codes. We then imply that users in those zip codes are high-wealth users. In all cases, none of the datasets are user-level.</p>	<p><b>No user-level data.</b> Census data is not associated with users, and therefore is not included in DYI. User zip codes are included in DYI.</p>

## **EXHIBIT C**

Below is a summary of the DYI files produced for the current and former named plaintiffs in this case, that describes the categories of “discoverable user data” in each file identified by Judge Corley in Discovery Order No. 9: (1) data collected from a user’s on-platform activity, (2) data obtained from third parties regarding a user’s off-platform activities, and (3) data inferred from a user’s on or off-platform activity. On (3), DYI includes data that, as a factual matter, makes use of a user’s on or off-platform activity. Whether that data constitutes inferred data is a legal question on which we do not take a position for the purpose of trying to identify data in this category.

## **EXHIBIT D**

[illegible]
